

Where federation ends up: GD (A) lands in its twin's basin and circuit; AdamW setups land in a different solution, and the transformers in a different circuit, even at K = 2

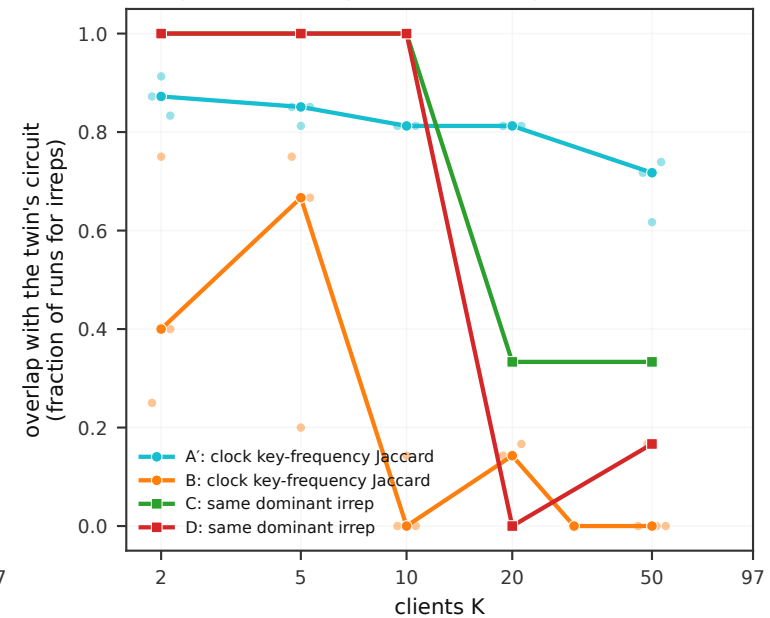

(a) how far the federated model ends from its twin

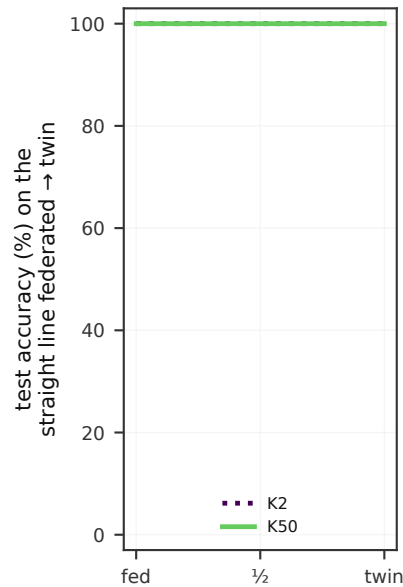

(b) do they represent the data the same way?

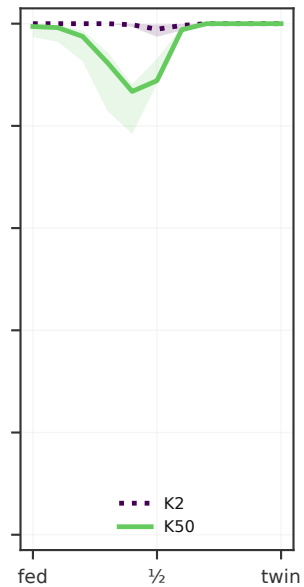

(c) do they use the same circuit? (A omitted: its clock is spread evenly over all 48 frequencies, so overlap is uninformative)

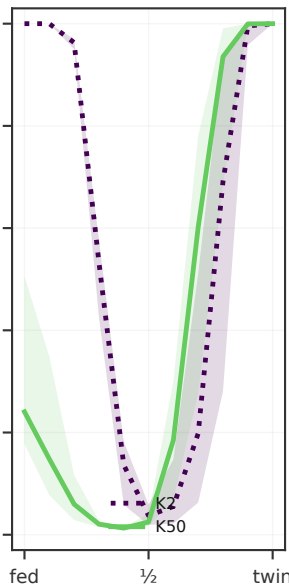

(d) A

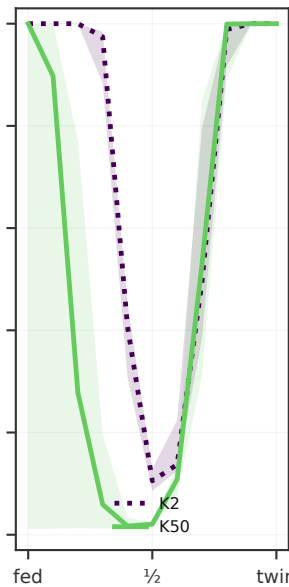

A'

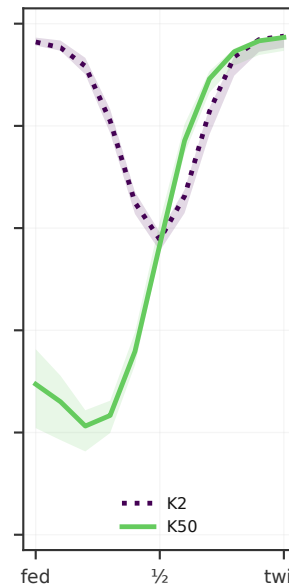

B (wd 1.0)

C

D

E
